

# AMIGA project. Active galaxies in a complete sample of isolated galaxies.

**José Sabater Montes on behalf  
of the AMIGA team.**  
Instituto de Astrofísica de Andalucía (CSIC).

# Outline.

- Environment and activity.
- Active galaxies selection.
  1. Literature data.
  2. Radio-excess selection.
  3. FIR colour selection.
  4. Optical spectra.
- Comparison with denser environments.
- Conclusions.

# Environment and active galaxies (AGN)

- The central supermassive black hole needs to be fed with gas. Probably the gas falls into the SMBH due to galaxy-galaxy interactions.
- Distinguish between intrinsic evolution and induced evolution of the AGN (nature vs. nurture). This question is not clear yet.
- AGN population in AMIGA isolated galaxies will be a baseline for the study of activity in relation to the environment.

# 1. Literature data

- NED
  - Information on activity type (Seyfert, LINER, starburst, HII).
  - N=77; **22 AGN**
- Véron-Cetty [Véron-Cetty & Véron 2003]
  - Active galaxies catalogue. 12<sup>th</sup> edition.
  - Information on Seyfert type.
  - N=25; **18 AGN**

## 2. Radio-excess selection. Radio-FIR correlation.

- Very tight correlation. Origin: Star formation.
- Radio-excess when radio emission is 5 times greater than FIR emission  $\Rightarrow$  radio AGN.
- 7/710 radio-excess galaxies.  $\sim 1\%$
- Very low rate.

Sabater et al. 2008

# Background sources.

- Background sources estimate using NVSS  $\sim 14$ .
- VLA study of the radio-excess galaxies.

# Background sources.

- Background sources estimate using NVSS  $\sim 14$ .
- VLA study of the radio-excess galaxies.

# Background sources.

- Background sources estimate using NVSS  $\sim 14$ .
- VLA study of the radio-excess galaxies.
- ALL background sources! **Rate of radio-excess galaxies = 0%.**

# 3. IRAS colour selection.

- Selection criterion of Yun et al. 2001:  
 $S_{25\mu\text{m}}/S_{60\mu\text{m}} > 0.18$
- 58 AGN candidates.

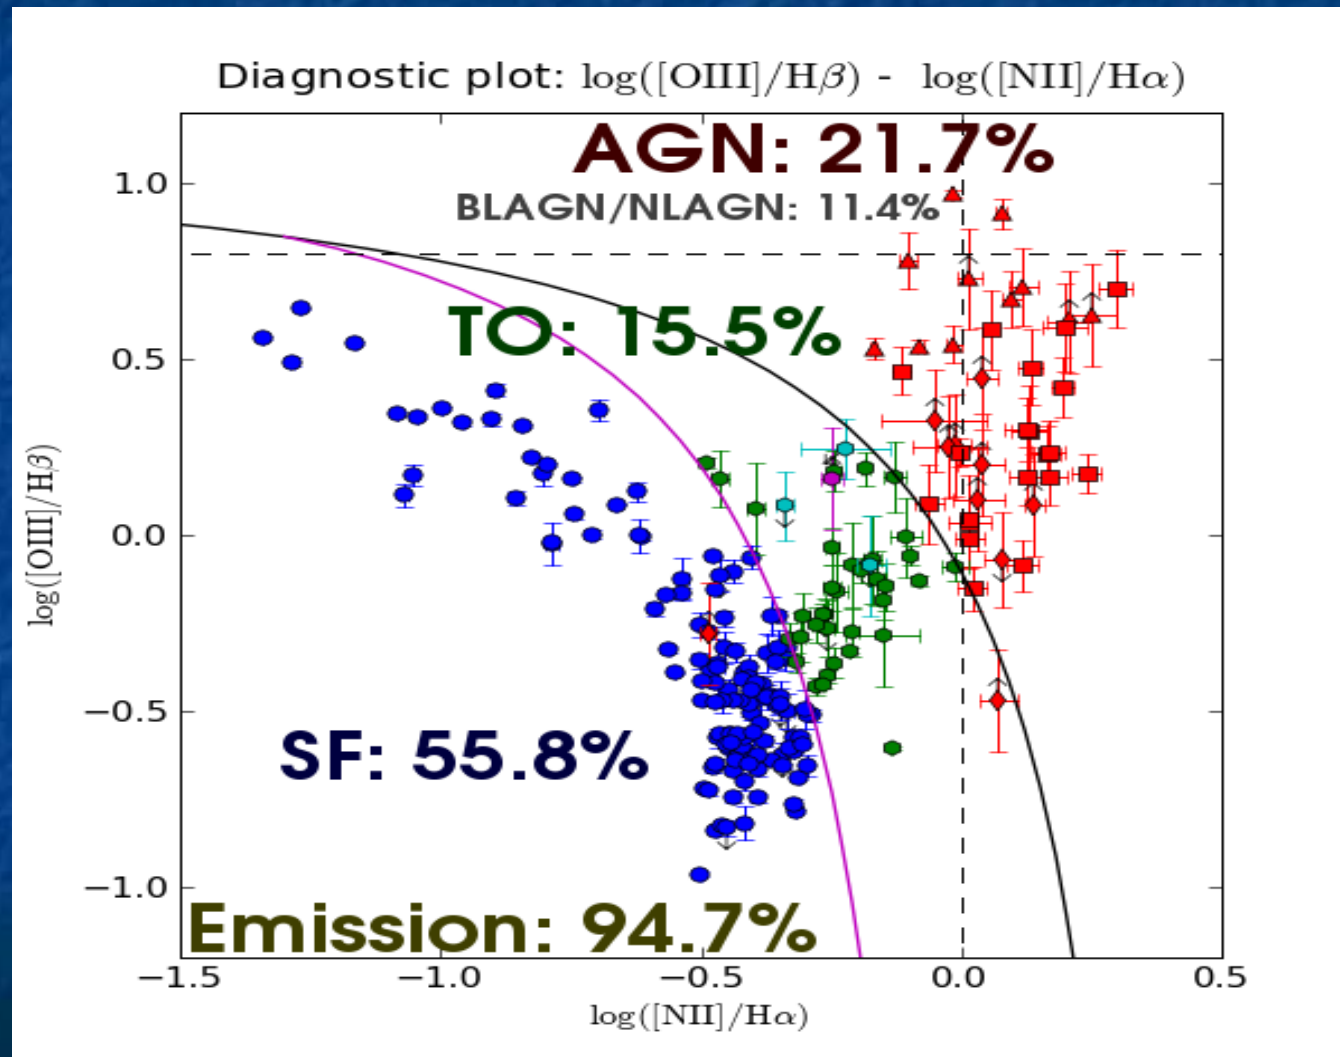

# 4. Optical spectra

- Sloan Digital Sky Survey – Data Release 6.
  - 353 spectra.
- Subtraction of stellar populations using Starlight.
- Fit of the lines.
- BPT diagnostic diagrams.
- Ongoing study.

# Diagnostic

# Diagnostic

# AGN fraction - luminosity

- Step increase of the fraction of AGN with luminosity

# AGN fraction - morphology

- Increase of the fraction of AGN towards early types

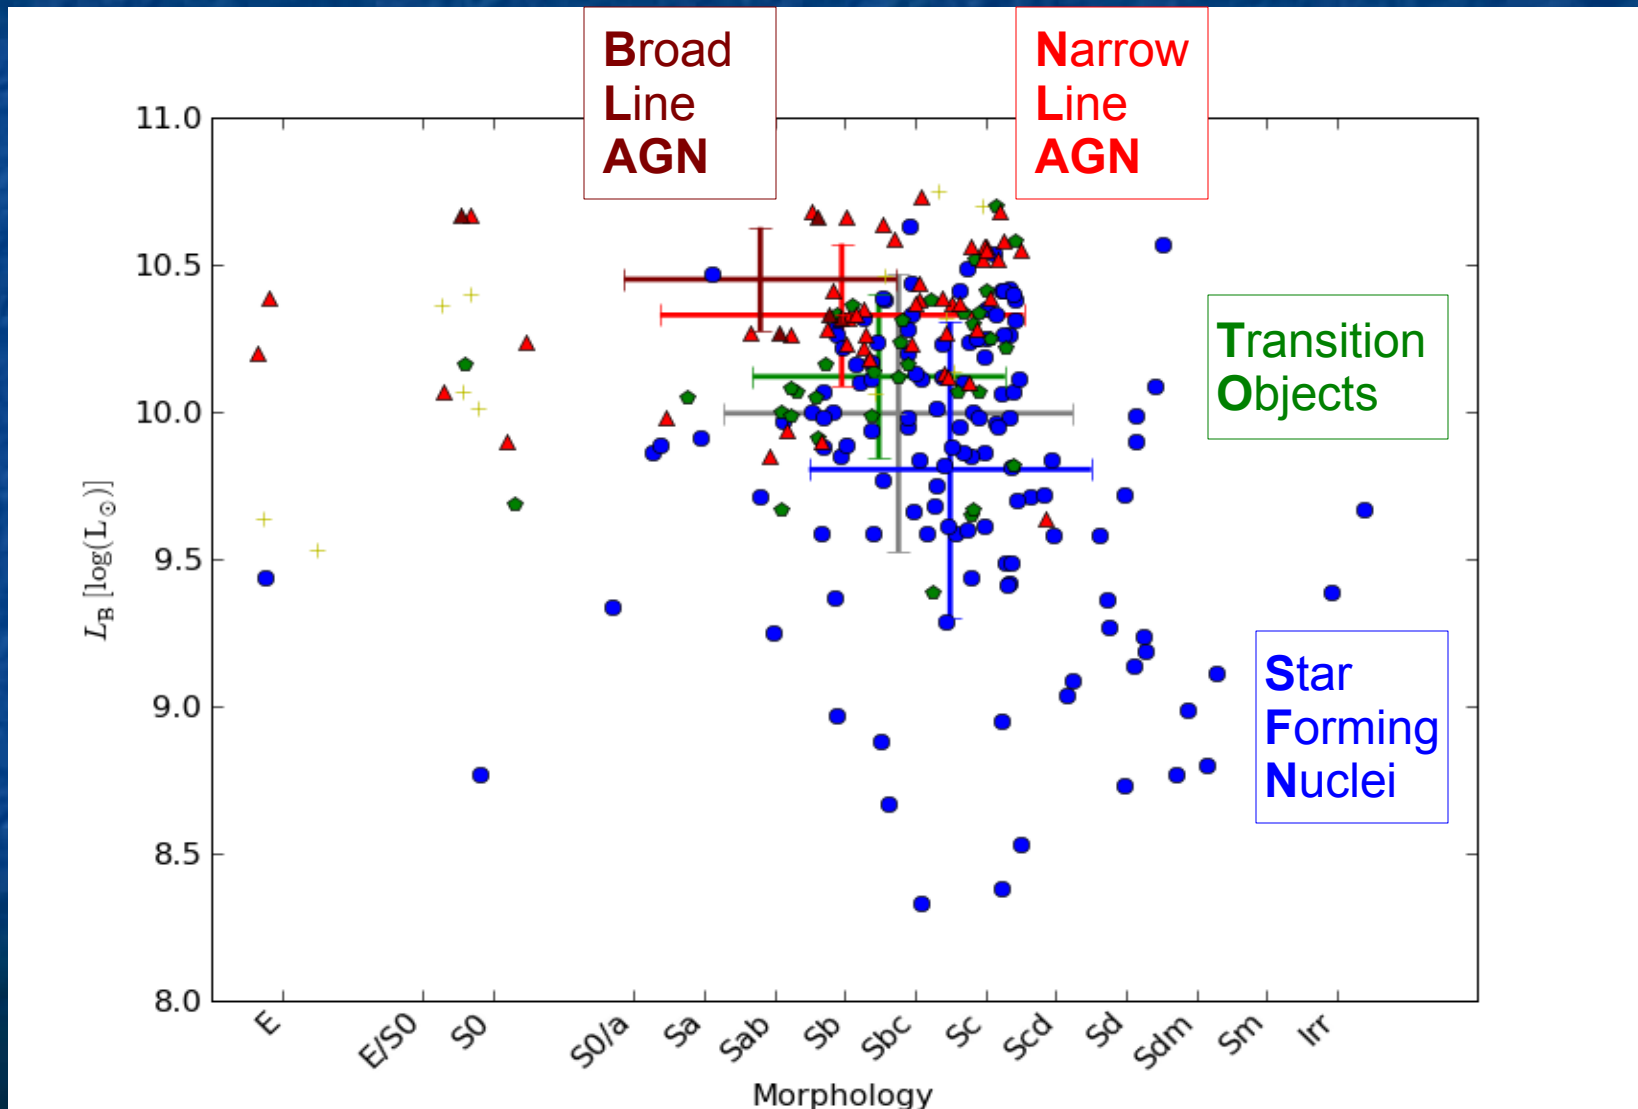

# AGN fraction - morphology

- Increase of the fraction of AGN towards early types

# Luminosity – morphology - AGN

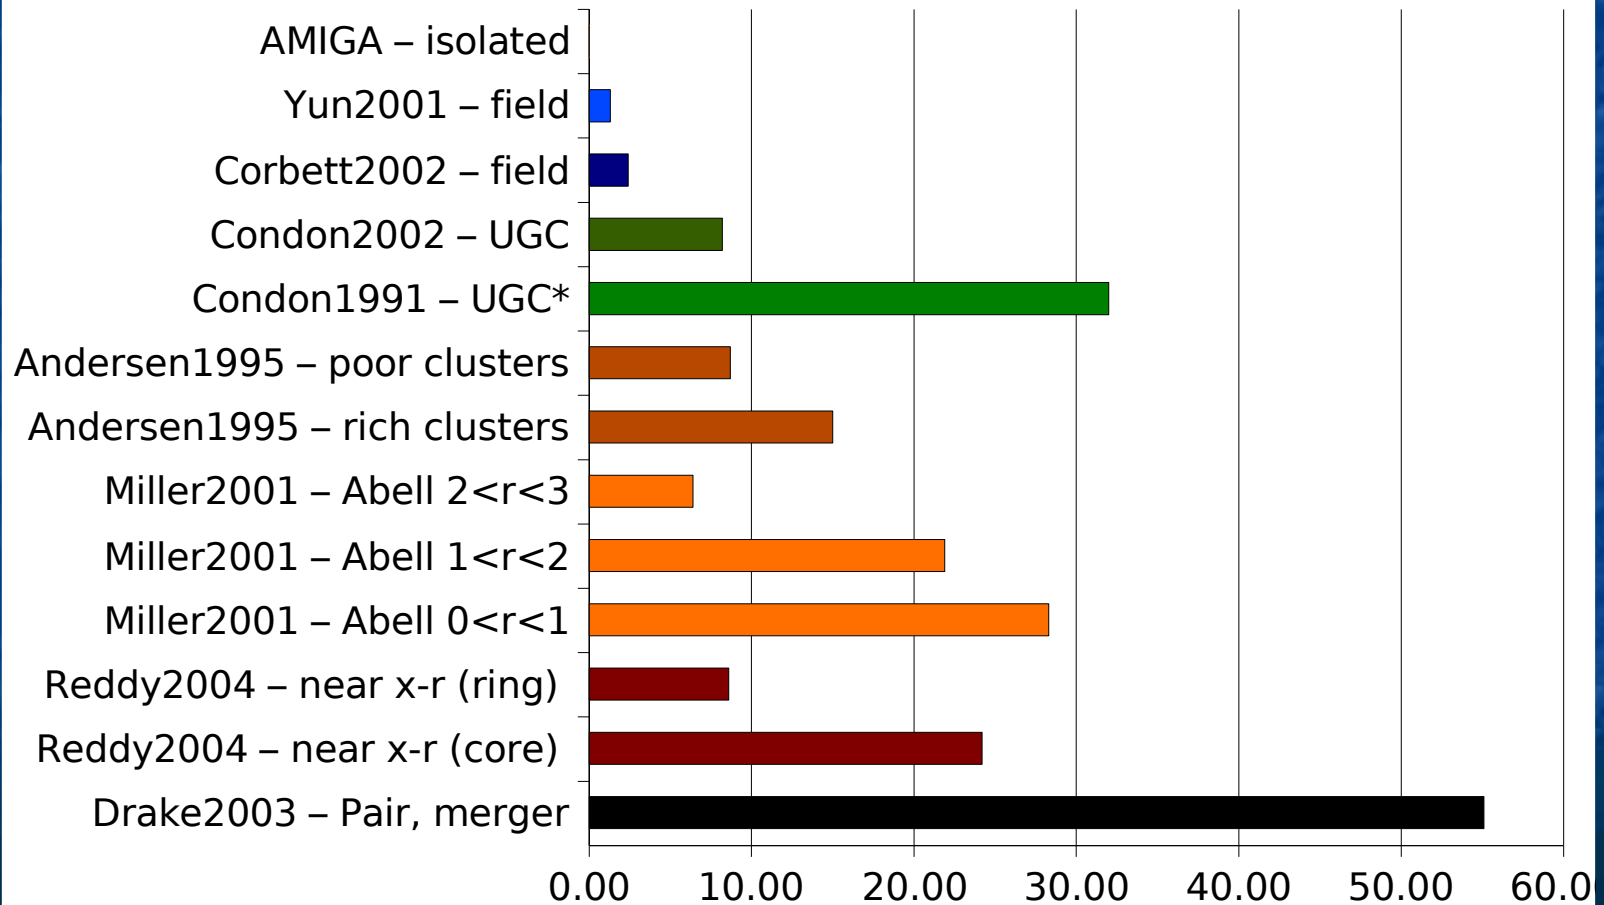

# Comparison with denser environments – optical AGN

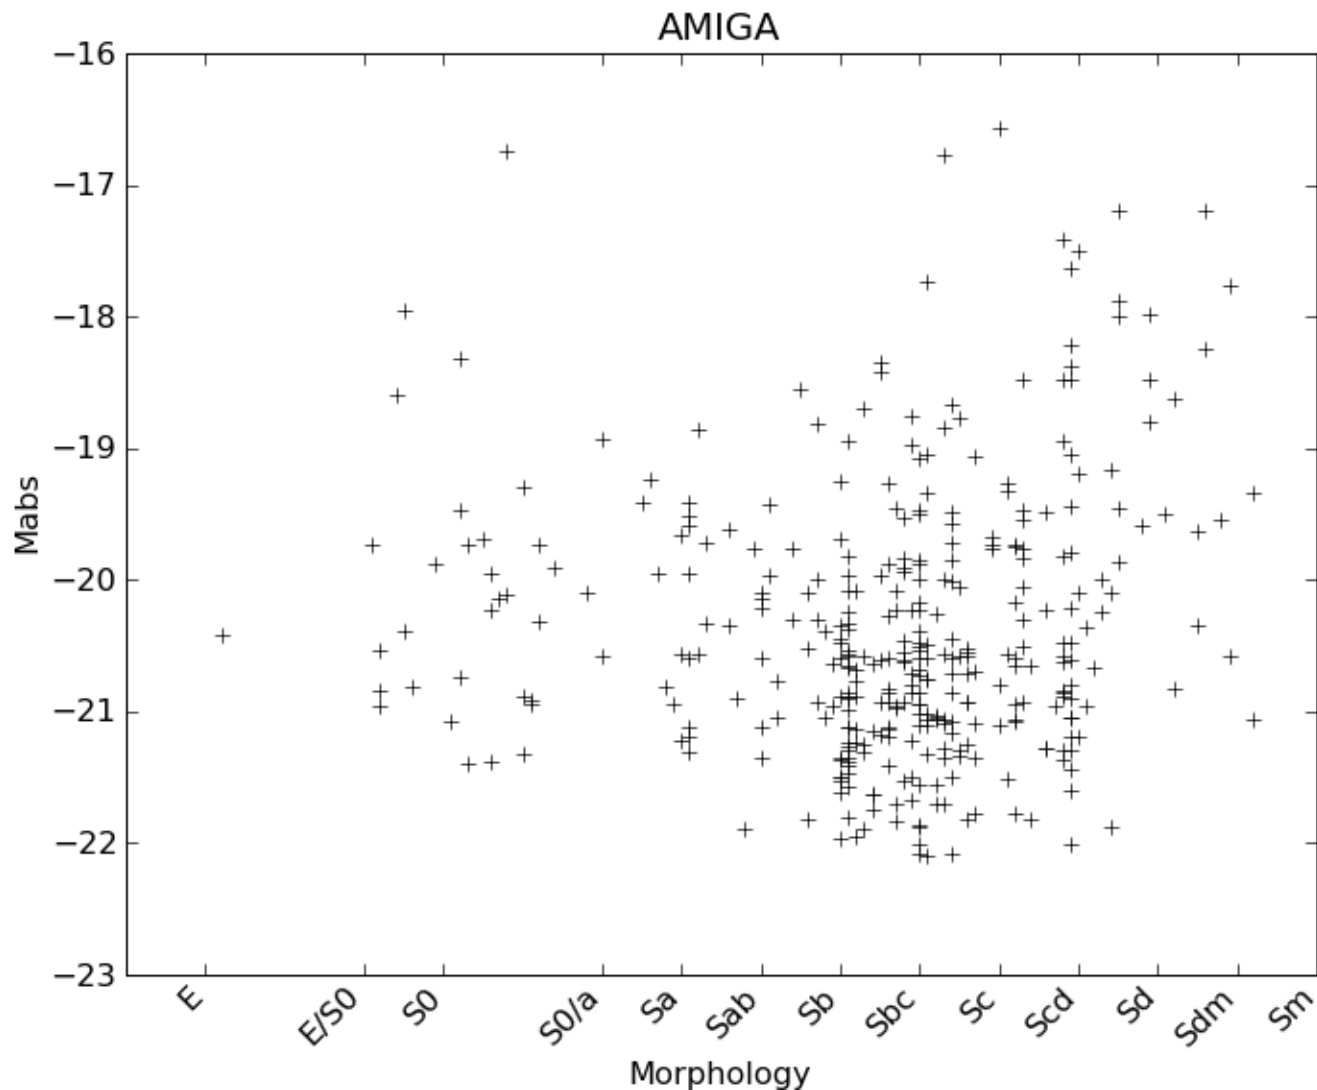

# Comparison with denser environments – radio AGN

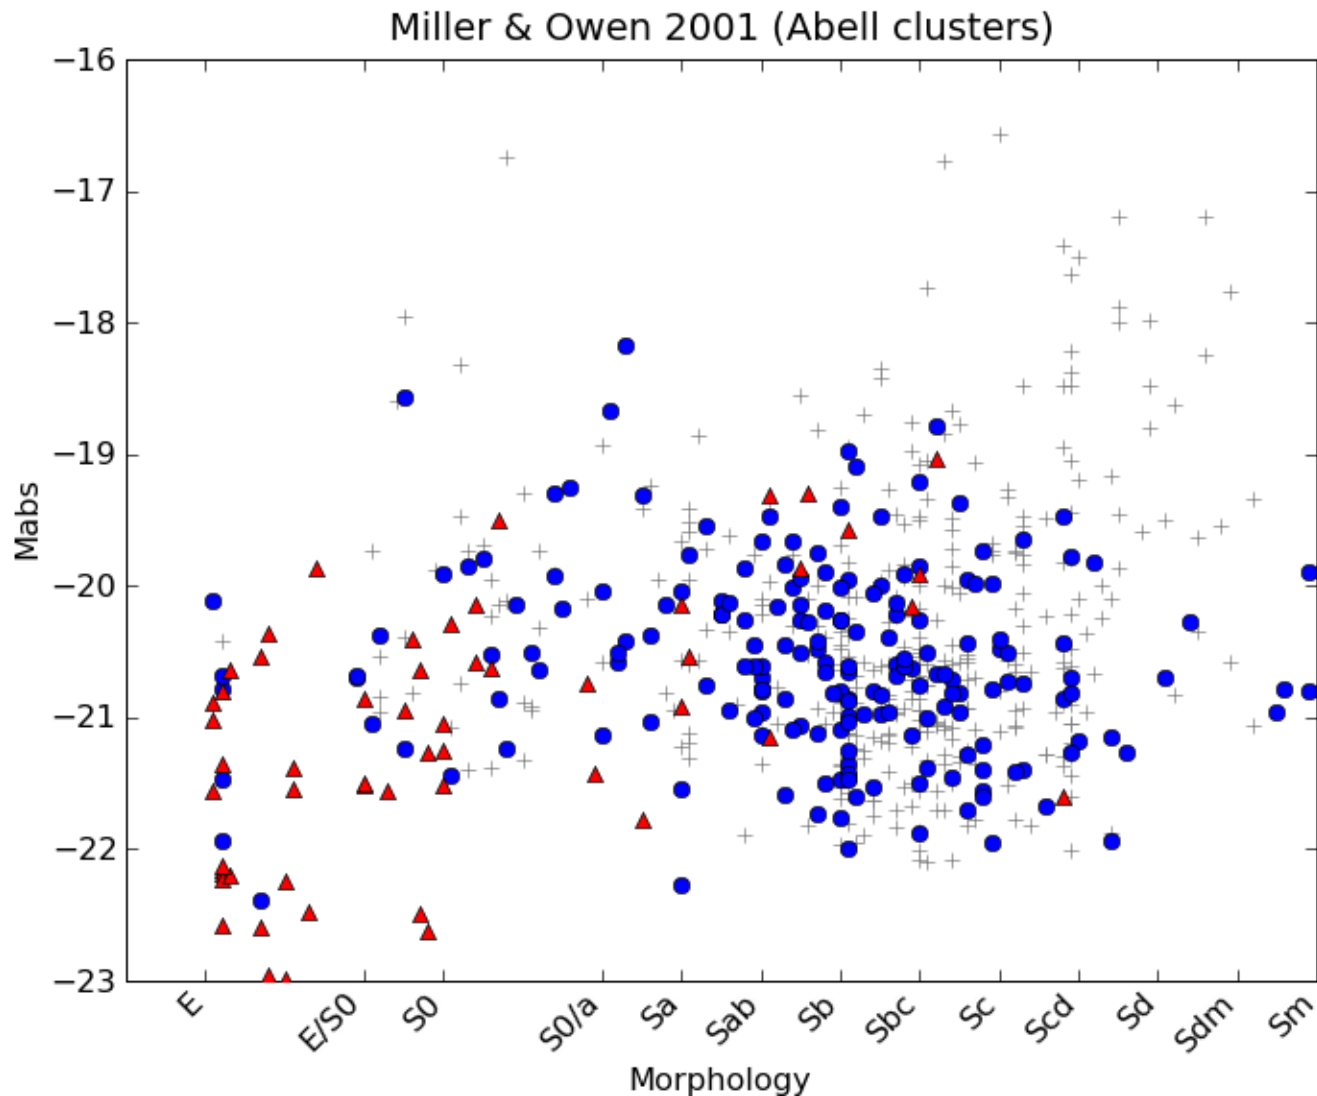

## Radio-excess rate (%)

# Comparison with denser environments – radio AGN

# Comparison with denser environments – radio AGN

# Conclusions.

- Final catalogue of active galaxies for the sample of isolated galaxies. Selected using literature data, radio-excess, FIR colour and optical spectra.
- ~21% of optically selected AGN. Significant fraction for a sample of isolated galaxies.
- Very low rate of radio-excess galaxies (~ 0%) compared to galaxies in denser environments.
- Not only explained by the luminosity / morphology-density relation.
- **Environment is fundamental for triggering radio AGN.**
