Introduction

- Role of the environment in the formation and evolution of galaxies;
- reference sample with minimum influence from the environment;
- properties of ISM as a function of isolation, and its relation to star formation, morphology, luminosities, nuclear activity.

Statistically significant sample of isolated galaxies

A- The sample of isolated galaxies

B- Complete multiwavelength information concerning the ISM:

1. Optical
2. H α
3. Infrared
4. Radiocontinuum emission
5. Molecular gas content
6. Atomic gas content

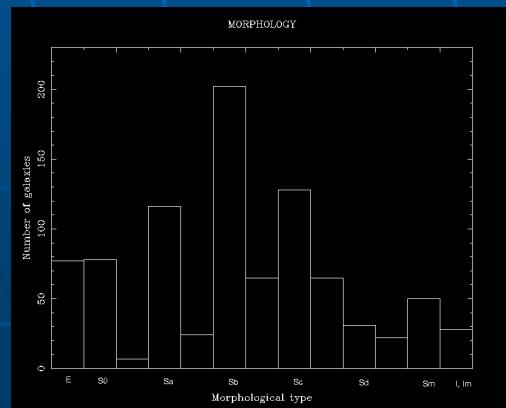

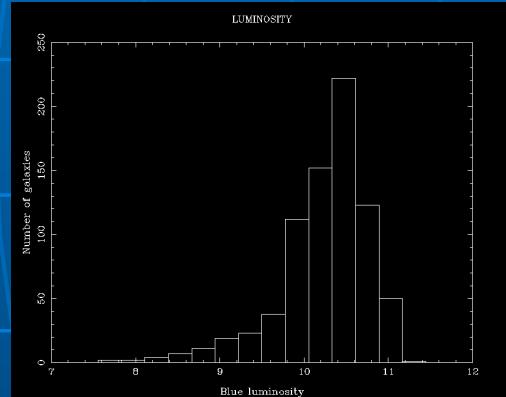

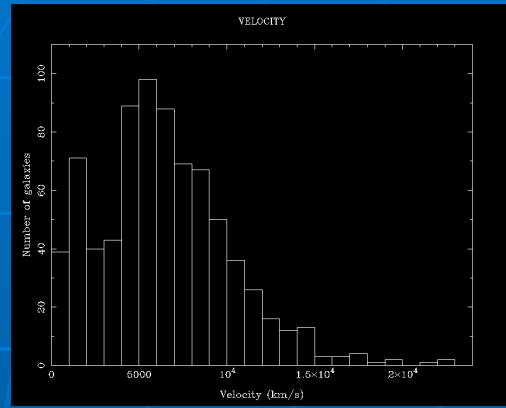

C- Public database

The Catalogue of Isolated Galaxies: CIG.

Isolation criterion (Karachentseva, 1973):

- No other galaxy within a distance of 20 times the galaxy diameter d
- $\frac{1}{4} d < d' < 4 d$
- POSS-I plates
- Northern hemisphere: dec $> -3^\circ$
- Optical magnitude: down to 15.7 (B band)
- 1051 isolated galaxies
- Revision (1980):
 - 0 – Isolated (893)
 - 1 – Marginally isolated (85)
 - 2 – Member of a group or a cluster (64)

The Catalogue of Isolated Galaxies: description of the sample.

a) **Velocity:** the CIG samples a deep enough volume of space to measure the radio, IR and optical luminosity functions;

b) **Blue luminosity:** large range of luminosities;

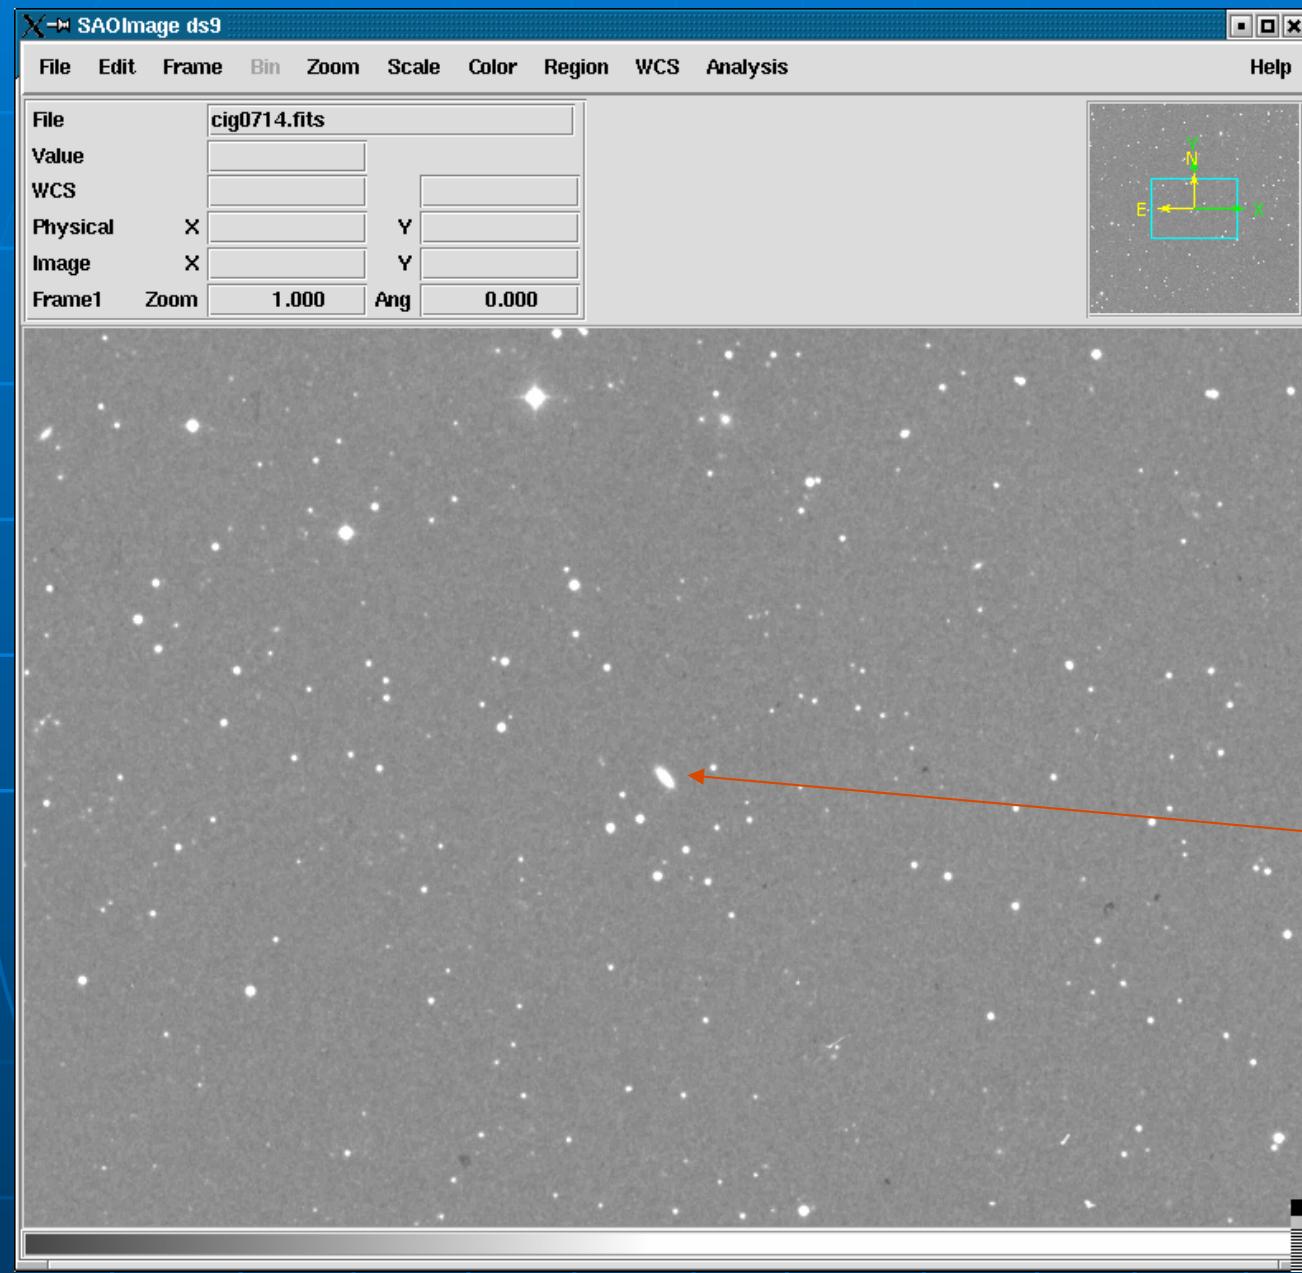

c) **Morphology:** the CIG is morphologically diverse to permit statistical studies correlated with Hubble type.

Checking the isolation criterion: our method.

- Local objects are excluded due to uncertain isolation determination (101 gal with $v < 1500$ km/s);
- 950 galaxies: our whole basic sample;
- DSS – POSSI;
- Star/Galaxy separation in each field around the isolated galaxy.

A- The sample of isolated galaxies

Checking the isolation criterion: the field.

CIG 0714

Checking the isolation criterion: star/galaxy separation

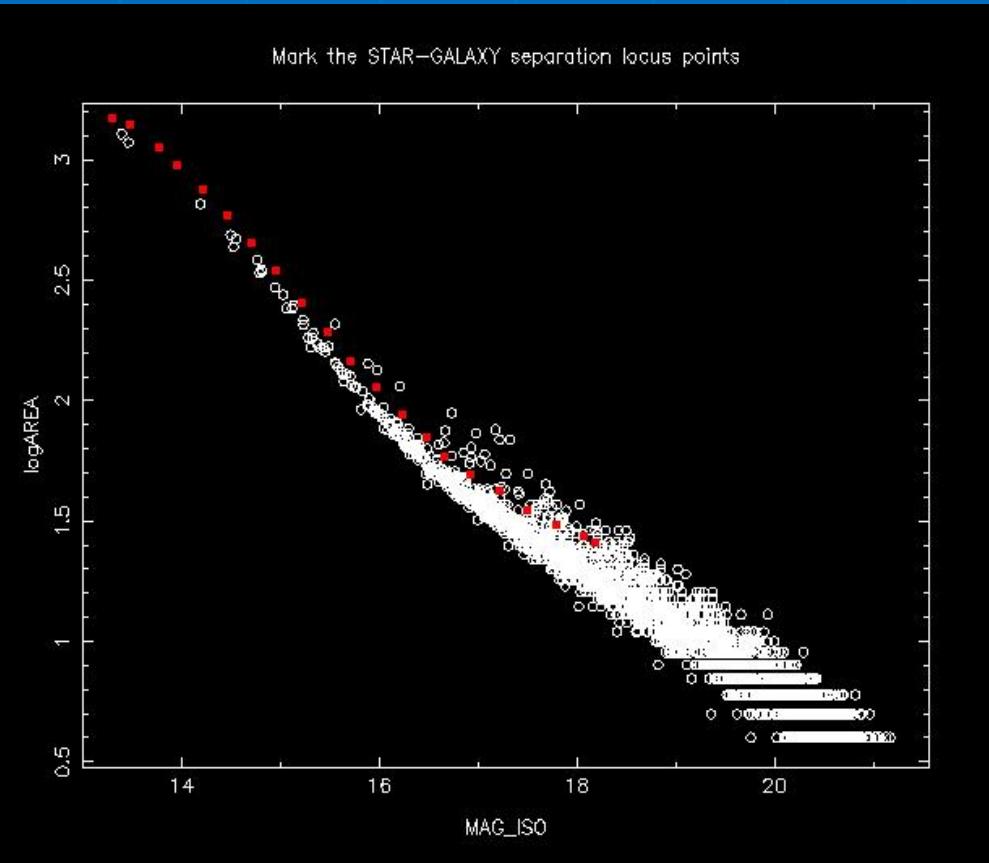

- Example CIG0714

- Extraction of sources: SExtractor

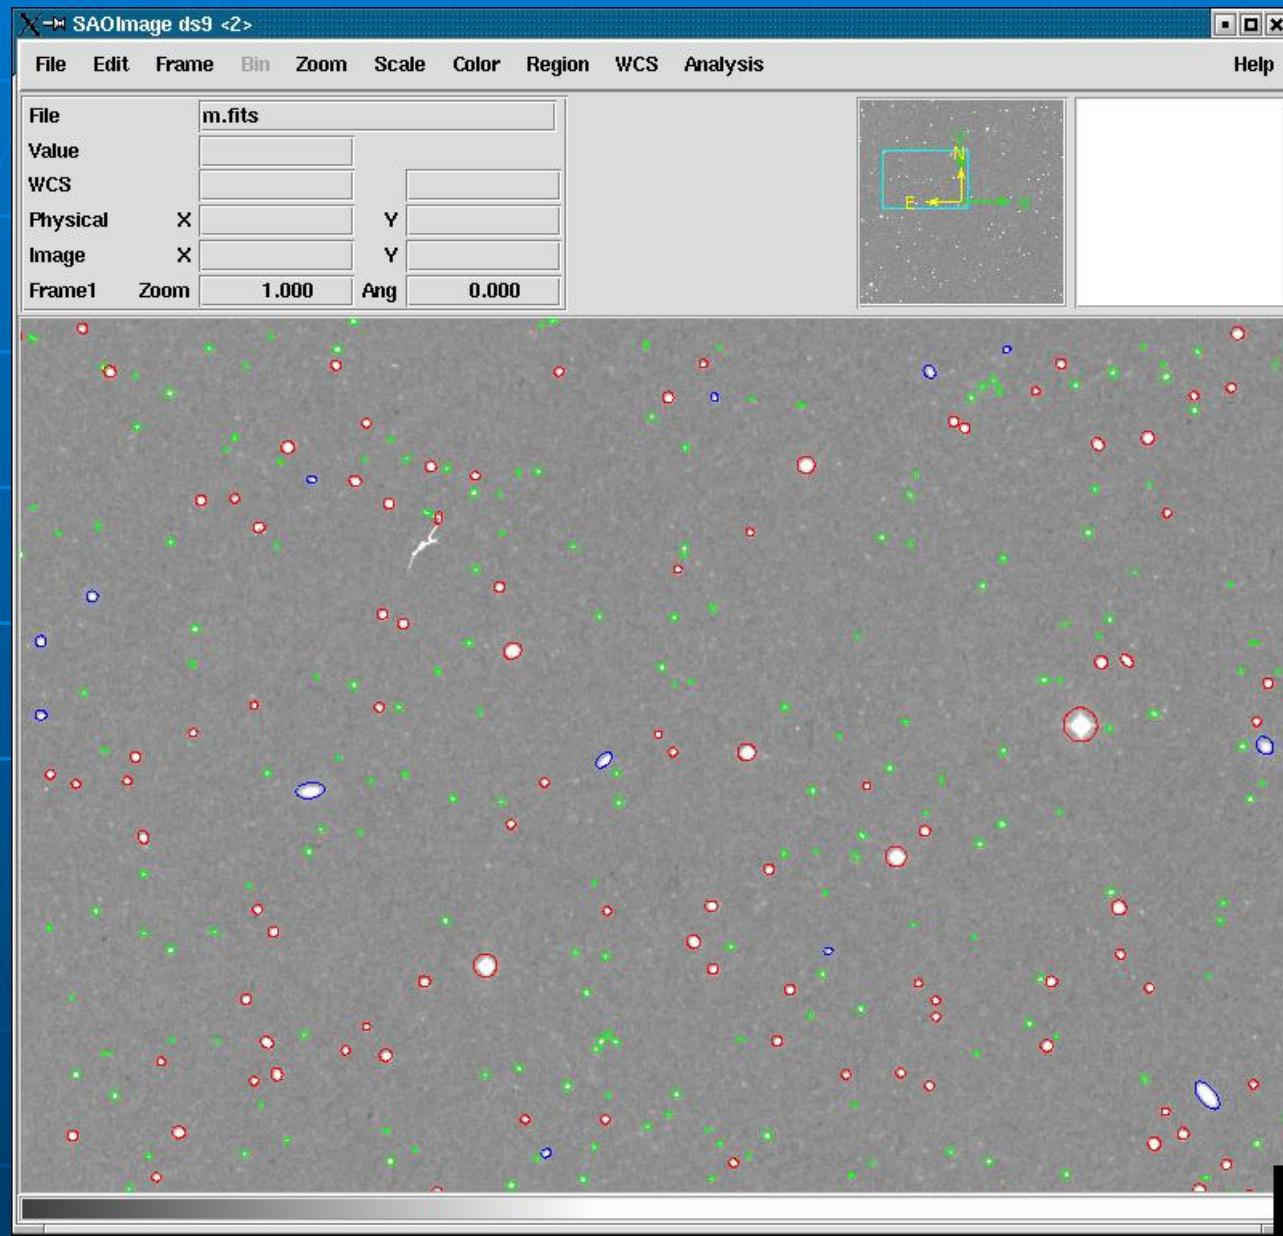

- Star/Galaxy separation: Line of demarcation

- Assigned type:

- Blue = galaxy
- Red = star
- Green = unknown

Checking the isolation criterion: other galaxies ?

Advantages of our method:

- extraction and S/G separation done with computer
- mag = 18
- redshift criterion
- isolation degree

Statistically significant sample of isolated galaxies

A- The sample of isolated galaxies

B- Complete multiwavelength information concerning the ISM:

- 1. Optical
- 2. H α
- 3. Infrared
- 4. Radiocontinuum emission
- 5. Molecular gas content
- 6. Atomic gas content

C- Public database

1. Optical

- Optical emission: L_B -Blue band- to account for the stellar content;
- sample: the 950 galaxies from CIG;
- data: blue luminosity from the Zwicky Catalogue.

Statistically significant sample of isolated galaxies

A- The sample of isolated galaxies

B- Complete multiwavelength information concerning the ISM:

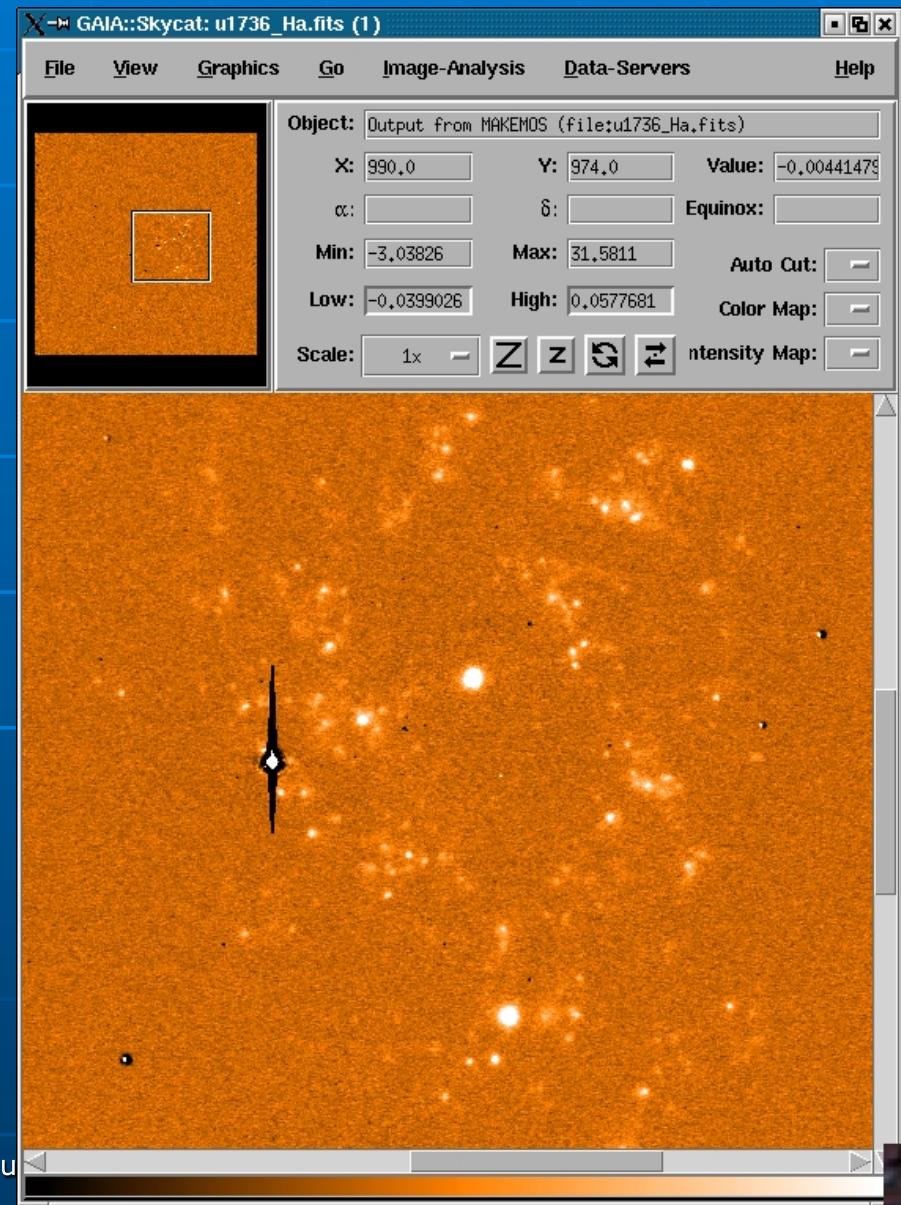

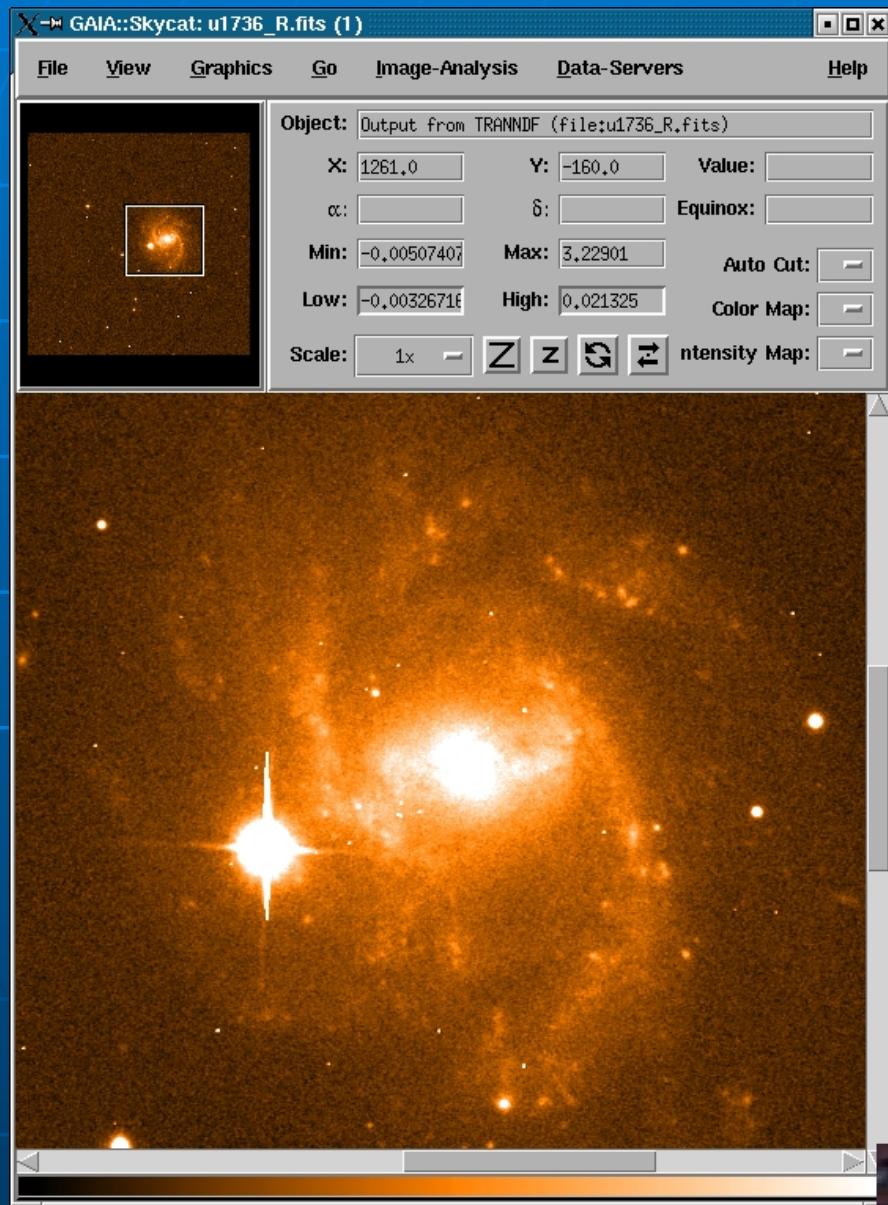

1. Optical
2. H α
3. Infrared
4. Radiocontinuum emission
5. Molecular gas content
6. Atomic gas content

C- Public database

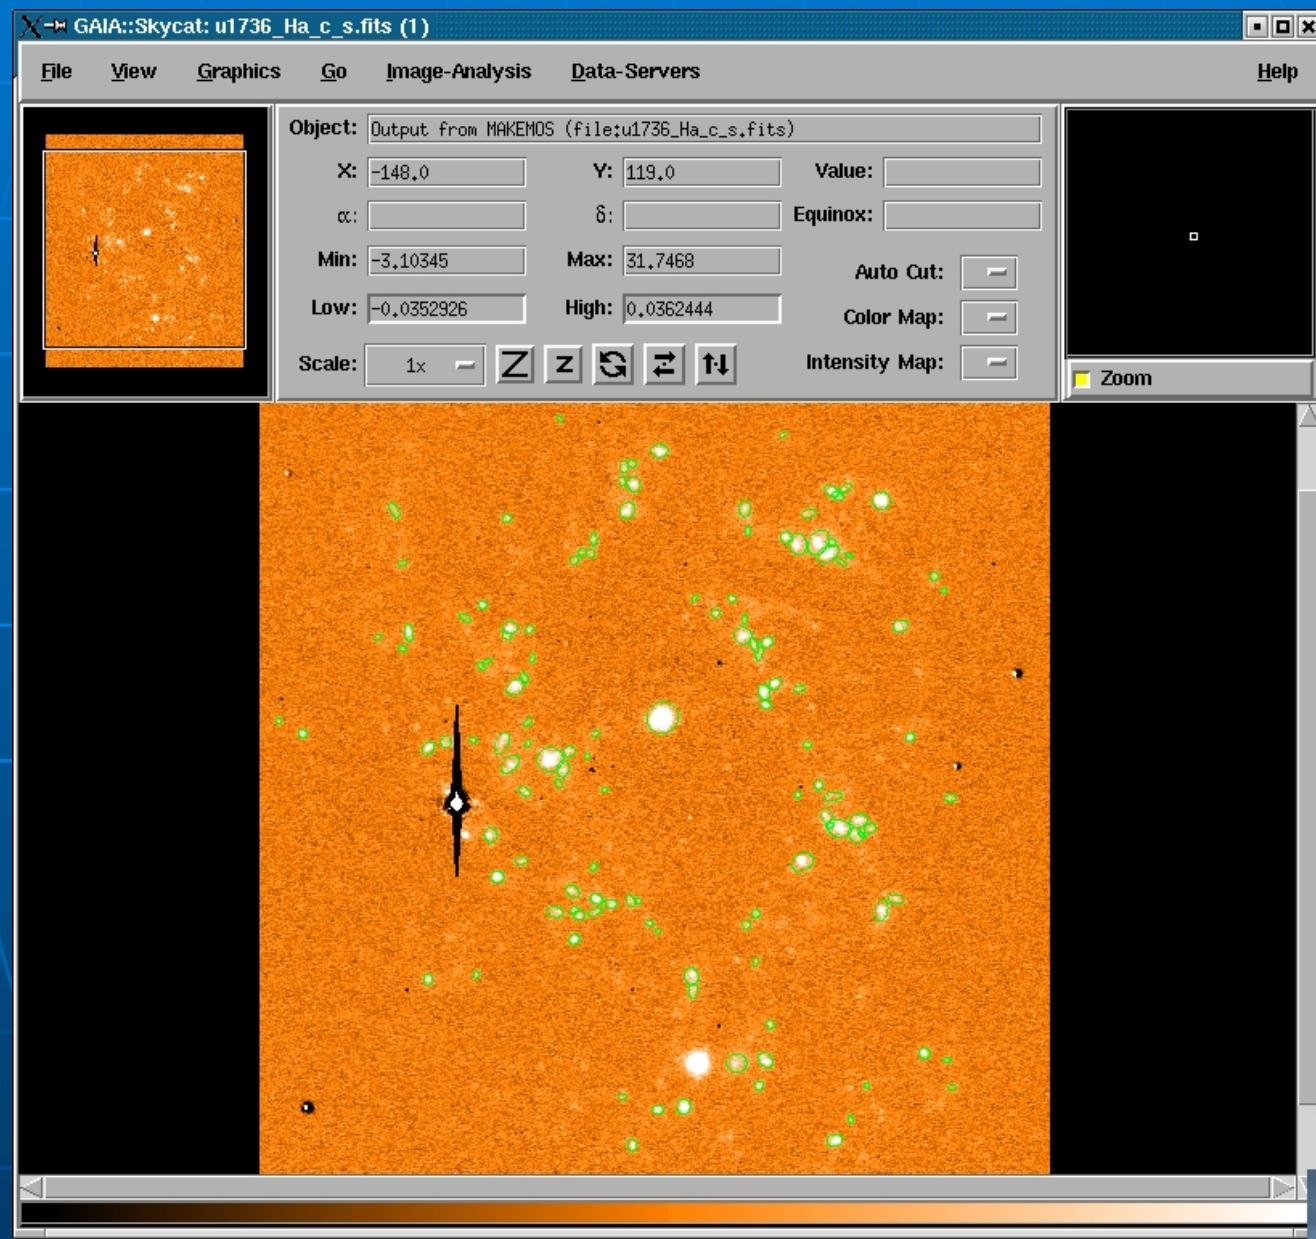

2. $H\alpha$

- $H\alpha$: recent star formation history tracer last $10 \cdot 10^6$ years, $M > 20 M_{\text{sun}}$;
- sample: redshift limited subsample, i.e. 206 galaxies with $1500 \text{ km/s} < V < 5000 \text{ km/s}$;
- data: CCD photometry;
- telescopes:
 - Sierra Nevada Obs.: 1.5m;
 - Calar Alto Obs.: 2.2m & 1.52m;
 - Jacobus Kapteyn Telescope: 1.5m;
 - San Pedro Martir: 1.5m.

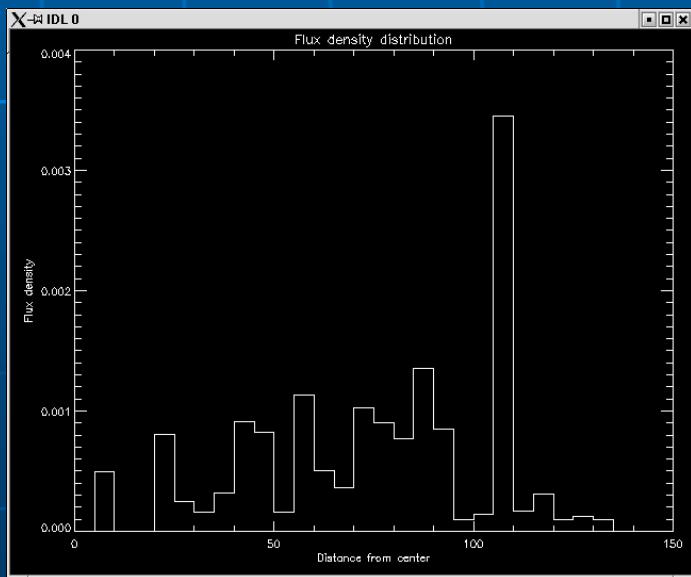

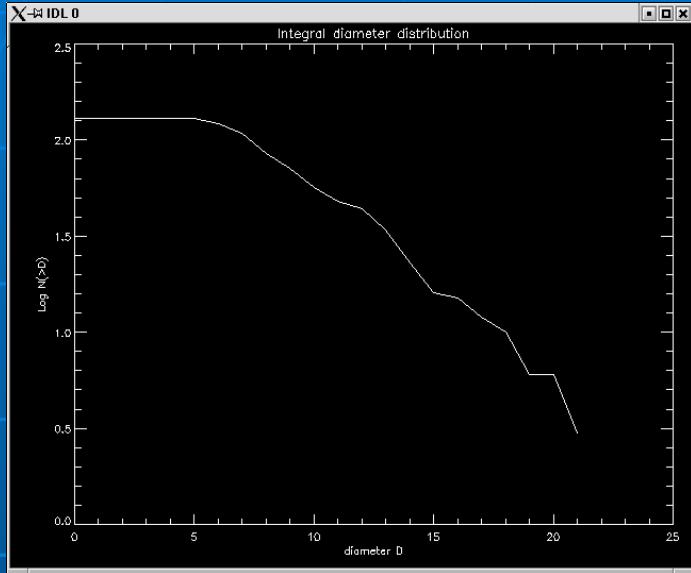

HII regions: example with CIG0096

Extraction of HII regions: example with CIG0096

Features of HII regions: example with CIG0096

Integral diameter distribution:

- fitted by an exponential of form $N(>D) = N_0 \exp(-D/D_0)$
- characteristic diameter: 63 pc

Flux density distribution

Statistically significant sample of isolated galaxies

A- The sample of isolated galaxies

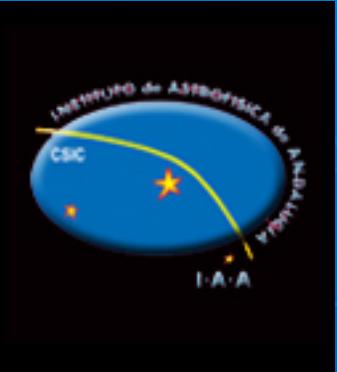

B- Complete multiwavelength information concerning the ISM:

1. Optical
2. H α
3. Infrared
4. Radiocontinuum emission
5. Molecular gas content
6. Atomic gas content

C- Public database

3. Infrared

- Far infrared: which corresponds to the thermal dust emission, warmed by young stars, $5 M_{\text{sun}} \rightarrow 100 \text{ Myrs}$;
- sample: the whole 950 galaxies CIG;
- data: IRAS data re-processed.

Isolated Galaxies

- Part II -

Daniel Espada Fernández
IAA-CSIC
Granada (Spain)

Vatican Observatory Summer School 2003

Statistically significant sample of isolated galaxies

A. The sample of isolated galaxies

B. Complete multiwavelength information concerning the ISM:

1. Optical
2. H α
3. Infrared
- 4. Radiocontinuum emission**
- 5. Molecular gas (C0 line)**
- 6. Atomic gas (HI line)**

C. Public database

4.Radiocontinuum emission

- RADIOCONTINUUM EMISSION: A tracer of the current SFR and the nuclear activity (AGN)
- SAMPLE: Whole sample.
Radiocontinuum surveys considered:

Survey	Frequency	resolution	Isolated galaxies of our sample found
WENSS	320 MHz	55''	139
NVSS	1.4 GHz	50''	622
GB6	4.8 GHz	7'	240

non thermal
(synchrotron radiation)

both thermal (free-free emission) and non thermal radiation

- GOALS:-Correlations with other wavelengths (FIR-Radiocontinuum, for example)

Statistically significant sample of isolated galaxies

A. The sample of isolated galaxies

B. Complete multiwavelength information concerning the ISM:

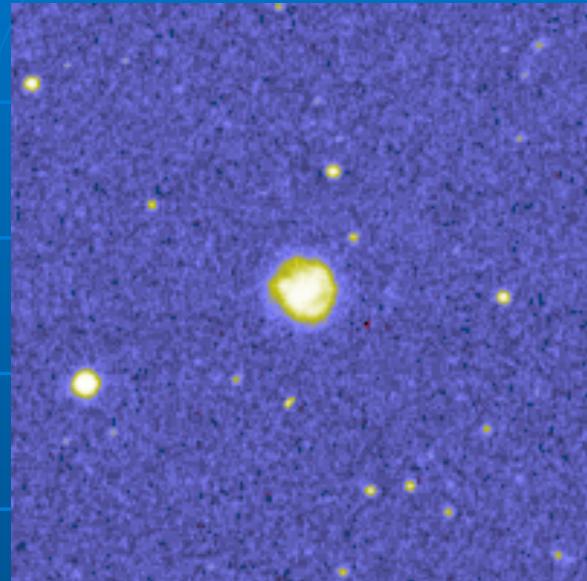

1. Optical
2. H α
3. Infrared
4. Radiocontinuum emission
5. Molecular gas (C0 line)
6. Atomic gas (HI line)

C. Public database

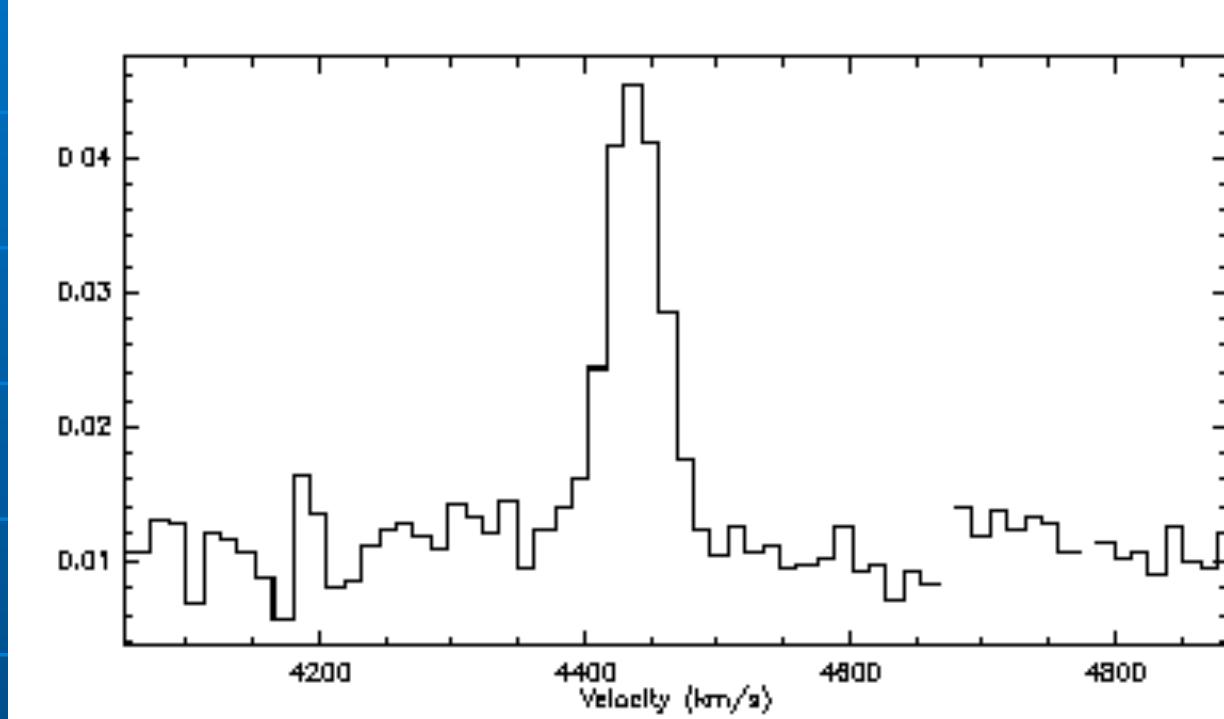

5.Molecular gas

- CO:Tracer of H₂, which is the material for the SF.
- SAMPLE: Redshift limited subsample.206 galaxies
- DATA:
 - Search in the literature.
 - Single dish observations .
Radiotelescopes: FCRAO 14m
(Massachusetts, USA) , IRAM 30m
(Granada, Spain), Nobeyama (Japan).
- GOALS: Compare with SF in denser environments

CO profile example: CIG 444

POSSI

Radial velocity : 4469 ± 9 km/s
Diameters (arcmin) : 0.8×0.8 '
Magnitude : 13.43
Type : SB(s)m

FCRAO 14m
Flux CO = 1.85 ± 0.11 K km/s
W=170 km/s
velocity CO= 4435 ± 20 km/s

Statistically significant sample of isolated galaxies

A. The sample of isolated galaxies

B. Complete multiwavelength information concerning the ISM:

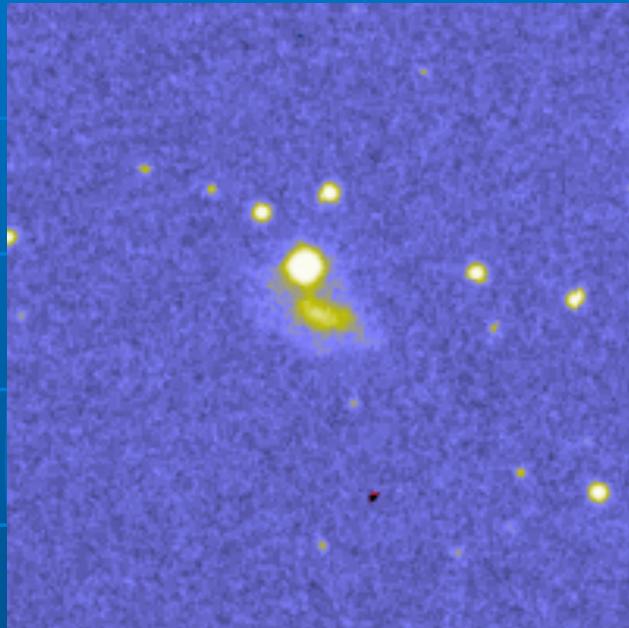

1. Optical
2. H α
3. Infrared
4. Radiocontinuum emission
5. Molecular gas (CO line)
6. Atomic gas (HI line)

C. Public database

6.Atomic gas

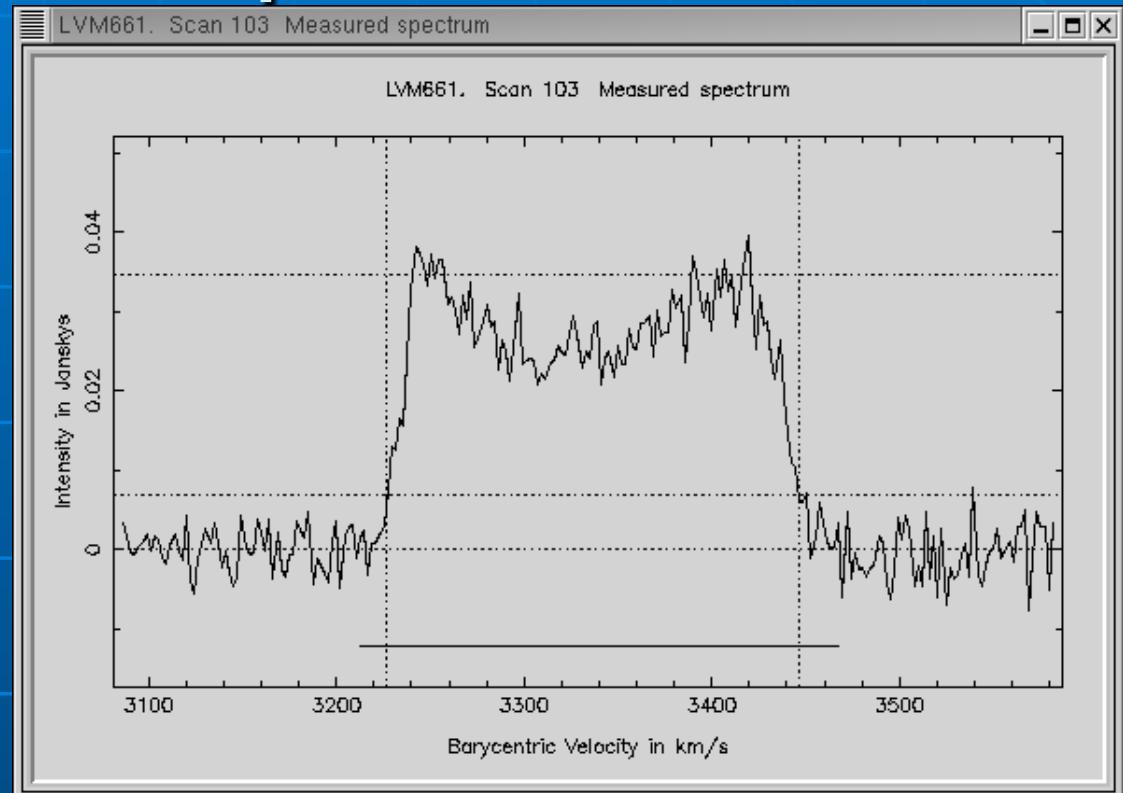

- HI: Extent is larger than optical. A very sensible tracer of interaction (and fundamental ingredient of ISM) .
- SAMPLE:
 - Whole sample.
 - Search in the bibliography.
 - Single dish observations at several radiotelescopes: Arecibo 304m, Effelsberg 100m, Nançay, NRAO 91m.
- GOALS:
 - HI content
 - Symmetry of the profiles

HI profile example: CIG 661

POSSI

Radial velocity : 3341 ± 9 km/s
Diameters: 1.3×0.9 arcmin
Magnitude : 15.1
Type: Sm

NRAO 91m
Flux HI = 6.05 ± 0.11 Jy km/s
W=220 km/s
velocity HI= 3336 ± 10 km/s

6.1.HI content

- REFERENCE OF ISOLATED GALAXIES

Until now the best reference was Haynes et al 1984 = 324 isolated galaxies observed in HI; or field galaxies.

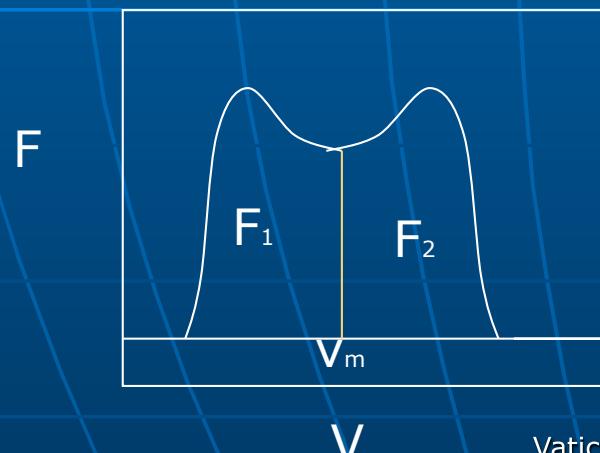

- DENSER ENVIRONMENTS

For example, spirals in clusters are HI deficients (Van Gorkom et al 1996) and some of them are stripped until 90 % of their atomic gas (Haynes et al 1990).

-> DEFICIENCY CAUSED BY INTERACTION

6.2.HI-profile asymmetry

- EXPLANATION OF LOPSIDENESS:
 - 1) Pointing offsets of the radiotelescope.
 - 2) Confusion with companions within the radiotelescope beam.
 - 3) Noncircular motions.
 - 4) True distortions in the HI mass distribution.

$$a = \frac{F_1}{F_2}$$

6.2.HI-profile asymmetry

1. OTHER SAMPLES OF ISOLATED GALAXIES

N=104 Haynes et al 1998

N=30 Matthews et al 1998

50 % of them have
asymmetric profiles!

2. OTHER ENVIRONMENTS

-Clusters

N=30 Sp Van Driel et al 1998 77%

N=1700 Richter & Sancisi 1994 50 %

(Visual examination)

-Groups

N=100 Sulentic & Arp 1983 most of asymmetric prof. are
not isolated galaxies

3. OUR SAMPLE OF ISOLATED GALAXIES

coming soon

Status of the project

- Isolation criteria: 77 % of the POSS fields checked
 - L_B y L_{FIR} for the whole sample
 - 36 % H α of the subsample observed
 - 67 % CO of the subsample observed or compiled
 - 85 % HI data has been observed or compiled
 - 80 % radio continuum reprocessed
